## Reduce Your Risk of a Breach

Rapid7's on-premise vulnerability management solution, Nexpose, helps you reduce your threat exposure by enabling you to assess and respond to changes in your environment real time and prioritizing risk across vulnerabilities, configurations, and controls.

Data breaches are growing at an alarming rate. Your attack surface is constantly changing, the adversary is becoming more nimble than your security teams, and your board wants to know what you are doing about it. Nexpose gives you the confidence you need to understand your attack surface, focus on what matters, and create better security outcomes.

If you are looking for more advanced capabilities such as Remediation Workflow and the Rapid7 Insight Agent, check out our platform-based vulnerability management software, InsightVM.

### Know Your Weak Points

You can't reduce risk if you can't find, validate, and contextualize it. Nexpose dynamically discovers your complete attack surface and finds vulnerabilities you are missing today. Understand your threat exposure by determining if your vulnerabilities can be exploited and if your compensating controls are deployed successfully. Contextualize the risks to get a true picture of them as they align to your modern digital business.

**Respond to Change Real Time with Adaptive Security:** Adaptive Security enables you to automatically respond to changes in your attack surface and the threat landscape. In addition to providing a baseline for full asset visibility and assessment, you can dynamically identify and assess changes on your network as they happen. From new assets joining the network, to scanning for new vulnerabilities as soon as they become available, you are able to stay on top of your risk between scheduled scans. Combined with dynamic connections to VMware and AWS, and integration with the Sonar research project, Nexpose provides live monitoring for your changing environment.

**Validate Vulnerabilities with Rapid7 Metasploit® Pro:** Not every vulnerability can be exploited. Nexpose verifies controls you have in place and seamlessly integrates with Metasploit, built on the world's most impactful penetration testing software, to validate vulnerability exploitability, test controls effectiveness, and drive effective remediation for proven risk. Exploits that are validated from Metasploit are automatically pushed to Nexpose for prioritization and remediation.

**Contextualize Assets Using RealContext™:** Not every risk is the same; context is everything. You must understand what matters to your business. Only Rapid7 RealContext™ provides contextual business intelligence to allow you to focus on the highest risks that matter to your business, through automated asset classification and risk prioritization. With RealContext™ you can shorten the window of attack on your highest risks and improve your team's productivity.

“Verdict: For a large enterprise – really, no matter how large – this product is well worth your consideration. It brings the power of significant functionality with a history of reliability and excellent support options.”

—SC Magazine

## Prioritize What Matters Most

It's impossible to remediate every risk. With Nexpose, the highest risks are prioritized using threat intelligence aligned with what's important to your business. Focusing your remediation efforts on taking the most impactful actions will allow you to reduce the most risk with the least amount of effort and keep your IT team focused.

**Focus on Your Highest Risks:** The standard 1-10 CVSS score results in thousands of "critical" vulnerabilities. Our Real Risk Score provides more actionable insight by also taking into account vulnerability age and public exploits/malware kits. Our 1-1000 scale highlights the vulnerabilities most likely to be used in an attack, helping you prioritize the most critical issues. When used with our robust tagging system, you can even prioritize the systems that are most critical to your business.

**Deliver Impactful, Actionable Remediation Plans:** Drive effective risk reduction and avoid distraction with a one-page, prioritized report that highlights the most impactful risks to the business. Save time by automatically assigning remediation plans using RealContext™. Targeted, concise, actionable, and clear step-by-step instructions enable IT teams to quickly remediate risk.

**Implement Best Practice Security Controls:** Do you know which security controls you should implement to reduce your risk of a breach? Nexpose identifies gaps in your defenses and provides a prioritized list of security controls to deploy on your endpoints and servers. This allows you to mitigate risks against today's threat landscape until vulnerabilities can be remediated.

## Get to the Fix, Fast

You need to prove that your decisions, in fact, are reducing risk. Nexpose allows you to easily see your risk level changing based upon your remediation efforts. Compare different IT remediation teams against each other to understand where you should spend energy and budget. Ensure you are compliant to both internal and external requirements for your vulnerability and risk management program.

**Drive Decisions Using Powerful Reporting:** Do you know where you should invest energy and budget? Nexpose allows you to see how your risk is changing over time, to determine if you are doing better or worse. Risk Scorecards allow you to easily benchmark different departments against each other to understand who is doing well and who isn't. This enables you to determine which teams need help and which teams you can learn from.

**Meet Vulnerability Management Compliance Requirements:** Nexpose enables organizations to stay compliant with PCI DSS, NERC CIP, FISMA (USGCB/FDCC), HIPAA/HITECH, Top 20 CSC, DISA STIGS, and CIS standards for risk, vulnerability, and configuration management. Unlike other solutions that may burden the network with multiple scans, Nexpose's fast, unified security and compliance assessment improves the performance of your security program by giving you a complete risk and compliance posture.
